

Project Based Learning -IV

Project Title:
Road Sign Classifier

Team Details:

Name: Anusha Dhiman(2210993768)

Name: Abhishake Bansal(2210993756)

Name: Hitesh Singla (2210993790)

Faculty Coordinator:

Ms. Chestha Dhingra

**Chitkara University Institute of Engineering and Technology,
Chitkara University, Punjab**

We, Anusha, Abhishake, and Hitesh, are delighted to introduce our project on '**Road Symbol Classifier**'.

The aim of our project is to **enhance road safety** through the application of advanced machine learning techniques.

The primary objective of our project is to swiftly and **accurately recognize traffic signs** from images, even in the most challenging situations.

- Recognizing traffic signs swiftly and accurately in diverse conditions is a critical challenge. **Variations in lighting, weather, and visibility** pose risks to road safety.
- Furthermore, **manual data collection** and labeling for training machine learning models can be time-consuming and resource-intensive.
- Our project relies on a substantial **labeled dataset** for effective model training. Leveraging advanced machine learning techniques, we address these challenges to ensure efficient and accurate traffic sign recognition, contributing to road safety and the advancement of autonomous driving.

The project is developed using a combination of advanced technologies, including Python, Flask, CNN, Keras and efficient data collection strategies:

Python: The core programming language for data preprocessing and machine learning model development.

Flask: The web framework used to create a user-friendly web application for image upload and classification.

Convolutional Neural Network (CNN): The deep learning architecture for image classification, enhancing traffic sign recognition.

Keras: The high-level deep learning library used for building and training the CNN model.

TensorFlow: TensorFlow is a python library for machine learning and artificial intelligence. It can be used across a range of tasks but has a particular focus on training and inference of deep neural networks.

Key Features

1. **High-Precision Traffic Sign Recognition**: Ensures accurate and reliable recognition of traffic signs for safer road navigation.
2. **Instant Results**: Real-time image classification provides instant feedback and decision support.
3. **User-Friendly Interface**: A user-friendly web application simplifies the process of uploading images and receiving classification results.
4. **Improved Road Safety**: Enhances road safety by reducing the risk of misinterpretation of traffic signs, reducing potential accidents.
5. **Robust and Adaptive**: Adapts to challenging conditions, such as variable lighting and weather, ensuring reliability.

In conclusion, our project has brought forth a transformative solution with tangible benefits for road safety and the transportation landscape. The **precise and real-time recognition** of traffic signs not only minimizes risks and potential accidents but also opens doors to autonomous driving integration.

This endeavor signifies the potential of advanced machine learning and deep learning technologies in shaping a safer and more efficient road landscape. We anticipate a future where road safety takes precedence and traffic management becomes highly efficient.
